

REDUCE GROWTH, INCREASE HEALTH, LESS FREQUENT PRUNING

NOTICE of Tree Work Near Power Lines

This is a notification from your electric utility with regard to maintenance of trees on your property near power lines.

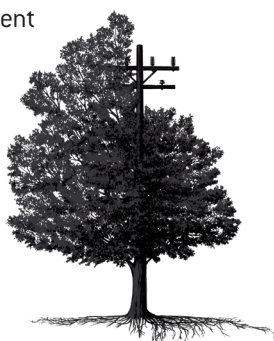

We will be applying a tree growth regulator (TGR) containing paclobutrazol to tree(s) on your property near power lines in the next few weeks.

Trees are a major cause of power outages, and when in contact with utility power lines create a hazardous situation. The practice of combining TGRs with pruning has been utilized safely by arborists and utility companies for decades to reduce tree-related power interruptions.

In addition to reducing the amount of pruning needed in the future, a growth regulator has the added benefit of improving the health of trees.

Benefits of TGRs

- There is no cost to you for treatment
- Trees have a healthier more natural appearance
- Trees will require less pruning in future years
- Less impact to your property and inconvenience when roads are blocked off
- Reduced tree-related power interruptions
- Reduced environmental impact – less noise, less fuel

FAQ's

How do I have my tree(s) included in this program?

To have your tree treated no additional action is needed. Within the next few weeks, we will treat trees near the power lines. We will knock on your door as a courtesy before applying the treatment.

What is the cost?

There is no cost to you associated with this service.

What can I expect after treatment?

The first response to treatment is commonly darker green leaves due to an increase in chlorophyll production. Over time your trees will become healthier and you will notice less growth resulting in a more compact tree.

How does the product work?

- Paclobutrazol is a proven tree growth management product that has been used by tree care professionals, utilities, universities, and agriculture for decades. It reduces tree growth, thereby decreasing the amount of pruning needed. It also enhances the health and appearance of the tree.
- Delivery is through soil injection, 4 to 6 inches beneath the ground, at the base of the tree. Paclobutrazol binds to soil particles, and has have limited mobility in all soil types. When applied according to the label by a licensed professional, it poses minimal exposure to people, pets, wildlife, and water sources.
- Paclobutrazol is the ideal tool for utility companies and their customers to improve how Right-Of-Way trees are managed in the urban forest.

Can I opt out of treatment?

Yes, the use of TGR's on your property is completely voluntary. Call the number below if you wish to do so. We also have experts available to answer any questions.
