

MLConnect Standard Fiber Installation

Exterior Construction/Delivery

Overhead Service*

If your current electric service enters your home above ground, you will get connected to MLConnect from an aerial fiber drop coming off a nearby electric pole to a NID.

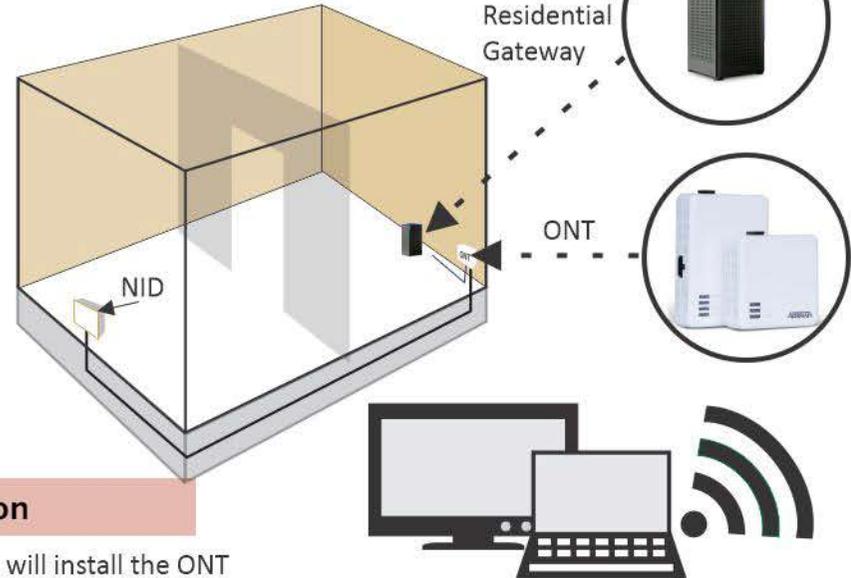

Underground Service*

If your current electric service is underground, MLConnect will install a fiber drop cable under your yard from a nearby electric pole to a NID.

** Construction/delivery of fiber to the home/business is not included in installation. Fees may apply if standard length of line is exceeded.*

*** Standard in-home/business installation is free. Some restrictions apply.*

Interior Installation**

Inside Installation

MLConnect technicians will install the ONT (Optical Network Terminal) in the optimal location inside of your house. A fiber cable will connect the outside NID (Network Interface Device) to the ONT, then an ethernet cable will connect to the Residential Gateway. If you purchase the phone service, a connection will be made at the ONT during installation.

Configuring Your Home Network

The MLConnect Residential Gateway is capable of running your entire home network. During installation, MLConnect technicians will configure the gateway to act as your main Wi-Fi access point. Network Extenders are also available if you need to extend your wireless range.
